

rmftools

June 2, 2019

Abstract

A suite of tools to assist in developing the response generation tasks.

1 Use

pipeline processing	no
interactive analysis	yes

2 Description

This package contains a suite of tasks to aid in the development of the tasks **rmfgen** and **arfgen**.

It currently contains the following tools

- **readrmf**, to view one or more rows of an RMF dataset
- **getcalresponse**, which displays the response information directly from the CAL, for a single row (expected to be removed in favour of **calview**).
- **readimage**, which converts one or more rows of an image into columns in a new table (for use with the FTOOL **dmpmf**).
- **comparermf**, which compares the RMF generated by **rmfgen** with that stored in the CAL. This is used to validate the RMF.

Of these, the task **readrmf** is considered useful to other developers and users, and a separate task description is written for this.
